

## Retractable lifelines

A retractable lifeline is a type of vertical lifeline that works somewhat like a seat belt in a car. The lifeline is coiled inside a protective housing. As you move up or down, the lifeline extends or retracts. The line is under constant tension and leaves no slack.

The moment you fall, the lifeline locks and stops your fall after a short distance.

Many retractable lifelines have fall indicators on their protective housings. **Do not** use the lifeline if the indicator shows that a fall has occurred.

After a fall, the manufacturer or the manufacturer's authorized agent must inspect the lifeline and approve it for continued use.

Always use a retractable lifeline block in the vertical position unless specifically allowed for by the manufacturer.
